Due tono stods wormerate energence (665°)

Due tono stods wormerate energence mas annugames:

$$Exy [(Ex (\mu(X)(x)) - EIy|x])^2$$
 $Ex (\mu(X)(x)) = C (7.4. |\mu(X) - EIy|x])^2$ 
 $Ex (\mu(X)(x)) = C (7.4. |\mu(X) - EIy|x])^2$ 
 $= Exy [Ex (\mu(X)(x)) - EIy|x]$ 
 $= Exy [Ex (\mu(X)(x)) - EIy|x]$ 
 $= Exy [Ex (\mu(X$ 

Теоретический расчет и результаты эксперимента не противоречат друг другу, при увеличении размера матрицы видна тенденция стремления к теоретическому значению.

Exy 
$$\Gamma(E_X(\mu(X)(x)) - E[y|x])$$
 $\mu(X): \hat{f}_x = \frac{1}{N} \sum_{i=1}^{N} \Gamma[x_i = x]y_i$ 
 $E_X(\mu(X)(x)) = E_X = \sum_{i=1}^{N} \sum_{i=1}^{N} \Gamma[x_i = x](f_x + E) = \sum_{i=1}^{N} \sum_{i=1}^{N} \Gamma[x_i = x](f_x + E) = \sum_{i=1}^{N} \sum_{i=1}^{N} \sum_{i=1}^{N} \Gamma[x_i = x](f_x + E) = \sum_{i=1}^{N} \sum_{i=1}^{N} \sum_{i=1}^{N} \Gamma[x_i = x](f_x + E) = \sum_{i=1}^{N} \sum_{$ 

Эксперименты в среднем дают около 0.0001, что близко к теоретически рассчитанному значению 0.
